Confidence:	96.67%

■ *Blood Test Results*

HB:	12.5
RBC:	5.2
MCV:	87.75
MCH:	27.2
MCHC:	32.8
RDW:	13.6
Age:	20.0

■ *AI Explanation*

Normal anemia, also known as normocytic anemia, is a condition where the body has a lower than normal number of red blood cells or the red blood cells do not have enough hemoglobin, but the size of the red blood cells is normal. This type of anemia is often caused by a lack of iron, vitamin B12, or folate, which are essential for the production of red blood cells. In the case of the patient, with a hemoglobin level of 12.5g/dL, which is slightly below the normal range for adults, and a mean corpuscular volume (MCV) of 87.75fL, which is within the normal range, the diagnosis of normal anemia is appropriate. This condition can be caused by various factors, including inadequate diet, certain medical conditions, or chronic diseases. For the patient, normal anemia may mean that they are at risk...
